Experiment – 1

a) Write a program to recognize strings starts with 'a' over {a, b}.

Code:

```
#include <stdio.h>

int main()
{
    char input[10];
    int i=0, state=0;

    printf("Enter a string:" );
    scanf("%s",&input);

    while(input[i]!='\0')
    {
        switch(state)
        {
            case 0:
                if (input[i]=='a')
                {
                    state=1;
                }
                else
                state=0;
                break;

            case 1:
                if (input[i]=='a')
                {
                    state=1;
                }
                else
                state=0;
                break;
        }
        i++;
    }
}
```

```
if(state==1){ printf("String is Valid");}  
else {printf("String is Invalid");}  
return 0;  
}
```

O/P:

```
Enter a string:abb  
String is Invalid
```

b) Write a program to recognize strings end with 'a'.

Code:

```
#include <stdio.h>  
#include <string.h>  
  
int main() {  
    char str[100];  
  
    // Prompt the user to enter a string  
    printf("Enter a string: ");  
    scanf("%99s", str); // Limiting input to avoid buffer overflow  
  
    // Get the length of the string  
    int length = strlen(str);  
  
    // Check if the last character is 'a'  
    if (length > 0 && str[length - 1] == 'a') {  
        printf("The string \"%s\" ends with 'a'.\n", str);  
    } else {  
        printf("The string \"%s\" does not end with 'a'.\n", str);  
    }  
  
    return 0;  
}
```

O/P:

```
Enter a string: abababa  
The string "abababa" ends with 'a'.
```

c) Write a program to recognize strings end with 'ab'. Take the input from text file.

Code:

```
#include <stdio.h>

#include <string.h>

#define MAX_LINE_LENGTH 100

void checkStringsEndingWithAb(const char *filePath) {
    FILE *file = fopen(filePath, "r");
    if (file == NULL) {
        printf("Error: Could not open file '%s'\n", filePath);
        return;
    }

    char line[MAX_LINE_LENGTH];
    printf("Strings that end with 'ab':\n");
    while (fgets(line, sizeof(line), file) != NULL) {
        // Remove trailing newline character if present
        size_t len = strlen(line);
        if (len > 0 && line[len - 1] == '\n') {
            line[len - 1] = '\0';
        }

        // Check if the string ends with "ab"
```

```
len = strlen(line);
if (len >= 2 && line[len - 2] == 'a' && line[len - 1] == 'b') {
    printf("%s\n", line);
}
}

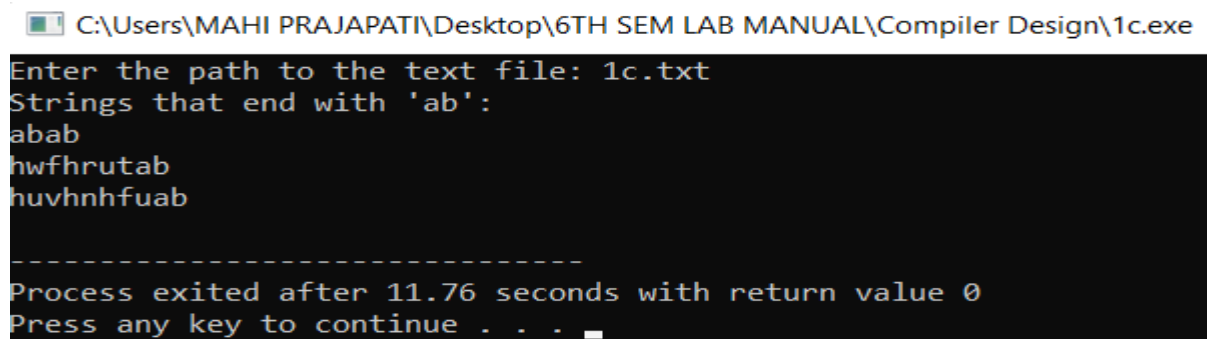

fclose(file);
}

int main() {
    char filePath[100];
    printf("Enter the path to the text file: ");
    scanf("%s", filePath);

    checkStringsEndingWithAb(filePath);

    return 0;
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\1c.exe
Enter the path to the text file: 1c.txt
Strings that end with 'ab':
abab
hwfhrutab
huvnhfuab
-----
Process exited after 11.76 seconds with return value 0
Press any key to continue . . .
```

d) Write a program to recognize strings contains 'ab'. Take the input from text file.

Code:

```
#include <stdio.h>

#include <string.h>

#define MAX_LINE_LENGTH 100 // Maximum length for each line

// Function to check strings containing "ab"
void checkStringsContainingAb(const char *filePath) {
    FILE *file = fopen(filePath, "r"); // Open the file in read mode
    if (file == NULL) {
        printf("Error: Could not open file '%s'\n", filePath);
        return; // Exit the function if the file cannot be opened
    }

    char line[MAX_LINE_LENGTH]; // Buffer to hold each line
    printf("Strings that contain 'ab':\n");

    // Read each line from the file
    while (fgets(line, sizeof(line), file) != NULL) {
        // Remove the trailing newline character if present
        size_t len = strlen(line);
        if (len > 0 && line[len - 1] == '\n') {
            line[len - 1] = '\0';
```

```
    }

    // Check if the string contains "ab"
    if (strstr(line, "ab") != NULL) {
        printf("%s\n", line);
    }
}

fclose(file); // Close the file
}

int main() {
    char filePath[100];

    // Prompt the user for the input file path
    printf("Enter the path to the text file: ");
    scanf("%s", filePath);

    // Call the function to check strings
    checkStringsContainingAb(filePath);

    return 0;
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\1d.exe
Enter the path to the text file: 1d.txt
Strings that contain 'ab':
ababab
abcc
hjklabjk
-----
Process exited after 5.695 seconds with return value 0
Press any key to continue . . .
```

Experiment – 2

a) Write a program to recognize the valid identifiers and keywords.

Code:

```
#include <stdio.h>

#include <ctype.h>

#include <string.h>

int main() {
    char input[20];
    int state = 0, i = 0;

    printf("Enter a string: ");
    scanf("%s", input);

    while (input[i] != '\0') {
        switch (state) {
            case 0:
                if (input[i] == 'i') {
                    state = 1;
                } else if (input[i] == '_' || isalpha(input[i])) {
                    state = 5;
                } else {
                    printf("Not a keyword or identifier\n");
                    return 0;
                }
            }
        }
```

```
break;
```

case 1:

```
if (input[i] == 'n') {  
    state = 2;  
} else if (input[i] == '_' || isalpha(input[i]) || isdigit(input[i])) {  
    state = 5;  
} else {  
    printf("Identifier: %s\n", input);  
    return 0;  
}  
break;
```

case 2:

```
if (input[i] == 't') {  
    state = 3;  
} else if (input[i] == '_' || isalpha(input[i]) || isdigit(input[i])) {  
    state = 5;  
} else {  
    state=0;  
    printf("Identifier: %s\n", input);  
    return 0;  
}  
break;
```

case 3:

```
    if (input[i] == '_' || isalpha(input[i]) || isdigit(input[i])) {  
        state = 5;  
    } else {  
        state=0;  
        printf("Keyword: int\n");  
        return 0;  
    }  
    break;
```

case 5:

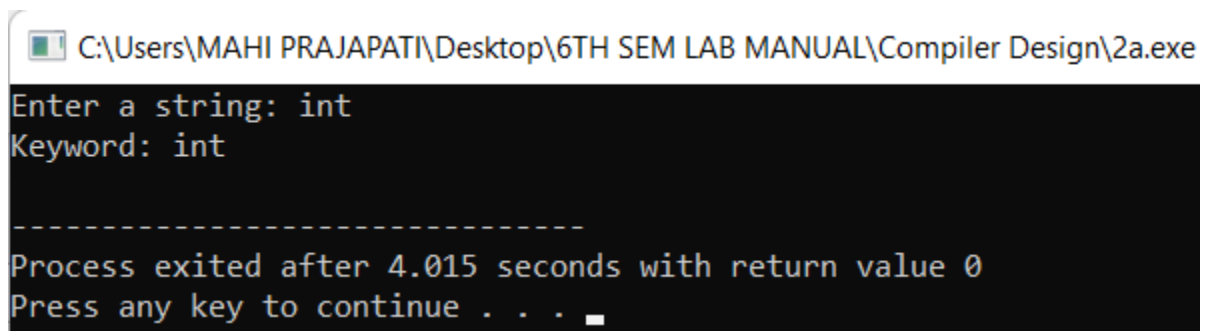

```
    if (input[i] == '_' || isalpha(input[i]) || isdigit(input[i])) {  
        state = 5;  
    } else {  
        printf("Identifier: %s\n", input);  
        return 0;  
    }  
    break;  
}  
i++;  
}
```

// Final state check

```
if (state == 3) {  
    printf("Keyword: int\n");
```

```
    } else if (state == 5) {  
        printf("Identifier: %s\n", input);  
    } else {  
        printf("Invalid input\n");  
    }  
  
    return 0;  
}
```

O/P:

b) Write a program to recognize the valid operators.

Code:

```
#include <stdio.h>  
#include <string.h>  
  
void recognize_operator(char *lexeme);  
  
int main() {  
    // Sample input string with various operators  
    char input[] = "+ - * / % == != < > <= >= && || ^ ~ !";  
  
    // Split the input string by spaces  
    char *token = strtok(input, " ");
```

```
// Loop through each token (operator) and recognize it
while (token != NULL) {
    recognize_operator(token);
    token = strtok(NULL, " ");
}

return 0;
}

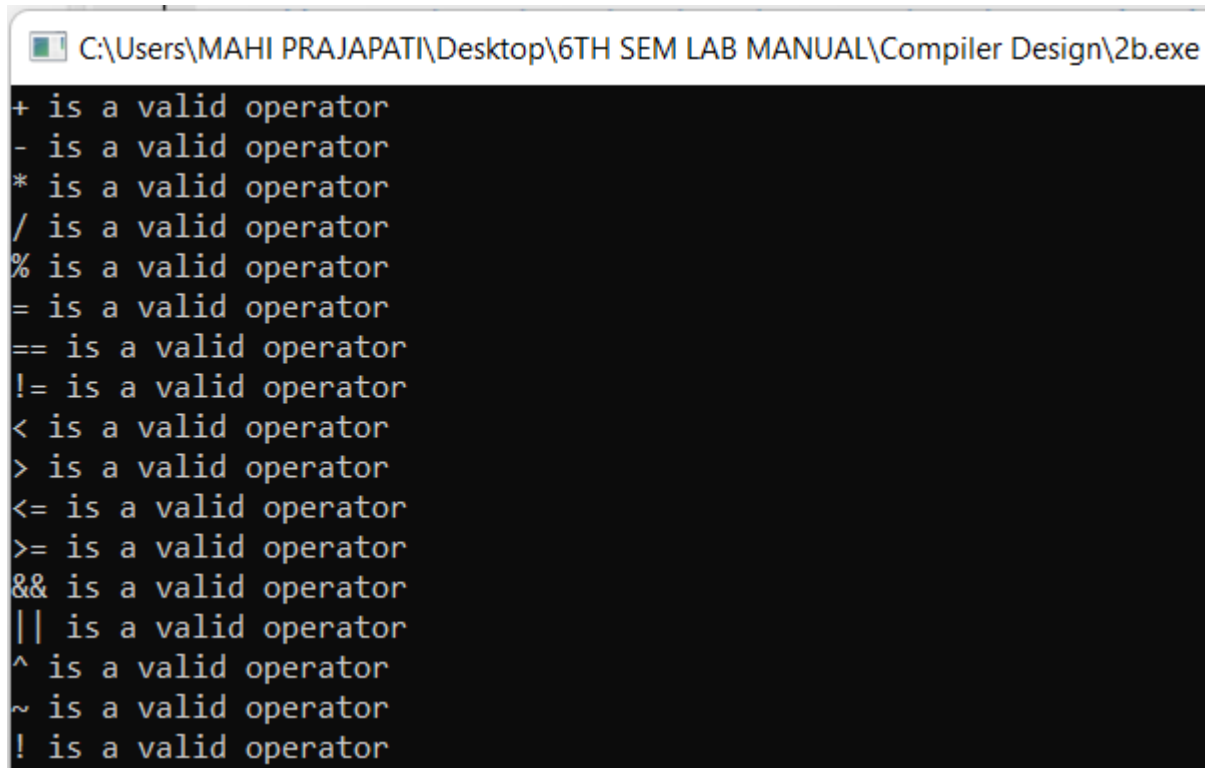

void recognize_operator(char *lexeme) {
    // List of valid operators
    char *operators[] = {"+", "-", "*", "/", "%", "=", "==", "!=", "<", ">", "<=",
">=", "&&", "||", "^", "~", "!"};

    int is_operator = 0;

    // Check if lexeme is a valid operator
    for (int i = 0; i < 18; i++) {
        if (strcmp(lexeme, operators[i]) == 0) {
            is_operator = 1;
            break;
        }
    }

    if (is_operator) {
        printf("%s is a valid operator\n", lexeme);
    } else {
        printf("%s is not a valid operator\n", lexeme);
    }
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\2b.exe
+ is a valid operator
- is a valid operator
* is a valid operator
/ is a valid operator
% is a valid operator
= is a valid operator
== is a valid operator
!= is a valid operator
< is a valid operator
> is a valid operator
<= is a valid operator
>= is a valid operator
&& is a valid operator
|| is a valid operator
^ is a valid operator
~ is a valid operator
! is a valid operator
```

c) Write a program to recognize the valid number.

Code:

```
#include <stdio.h>
#include <ctype.h>
#include <string.h>
#include <stdlib.h>

void recognize_number(char *lexeme);

int main() {
    // Sample input string containing potential numbers
    char input[] = "123 45.67 3.14e5 0.003 -123 56e-3 1000.0";

    // Split the input string by spaces to analyze each token
    char *token = strtok(input, " ");

    // Loop through each token (number) and recognize it
    while (token != NULL) {
        recognize_number(token);
    }
}
```

```
        token = strtok(NULL, " ");
    }

    return 0;
}

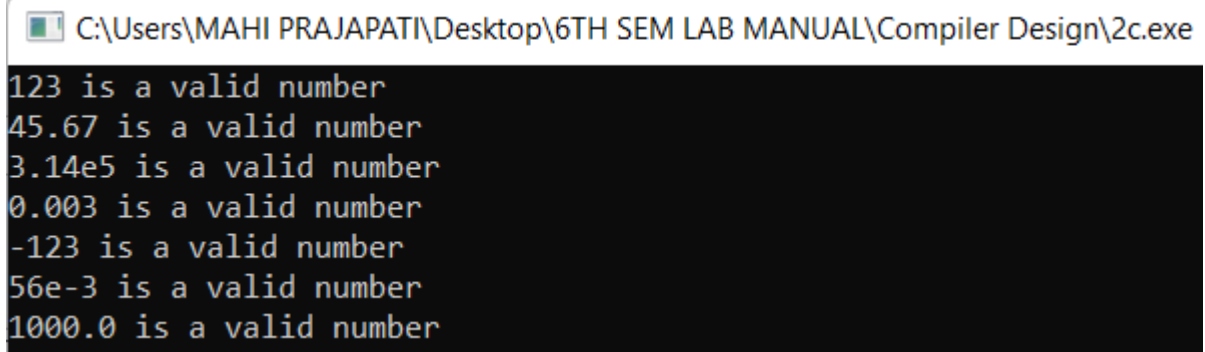

void recognize_number(char *lexeme) {
    // Regular expressions to check for valid numbers
    int is_valid = 1;

    // Check if the number is a valid integer or floating-point number
    // Integer: can have optional + or - sign, digits
    // Floating-point: can have an optional sign, digits, and a decimal point with
    // digits after it
    // Scientific notation: can be 'e' or 'E' followed by an optional sign and digits

    // Check if it's a valid integer or decimal
    char *endptr;
    strtod(lexeme, &endptr); // Converts string to double
    if (*endptr != '\0') { // If the endptr points to non-null, it's an invalid
number
        is_valid = 0;
    }

    // If valid number
    if (is_valid) {
        printf("%s is a valid number\n", lexeme);
    } else {
        printf("%s is not a valid number\n", lexeme);
    }
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\2c.exe
123 is a valid number
45.67 is a valid number
3.14e5 is a valid number
0.003 is a valid number
-123 is a valid number
56e-3 is a valid number
1000.0 is a valid number
```

d) Write a program to recognize the valid comments.

Code:

```
#include <stdio.h>
```

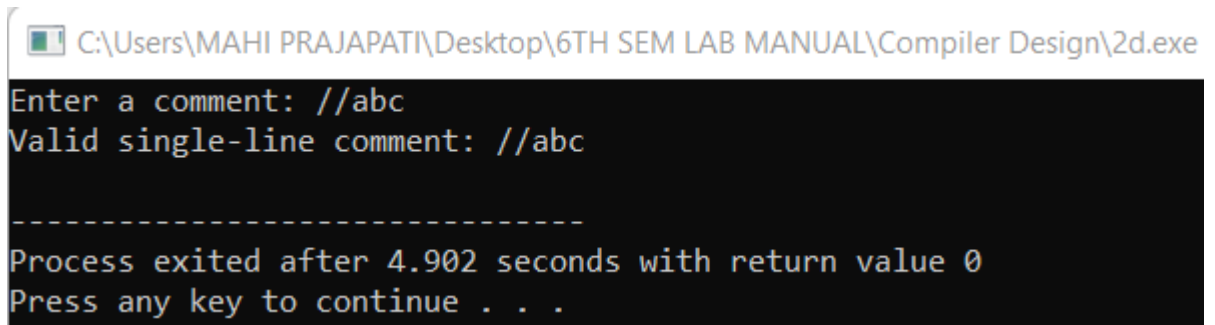

```
#include <string.h>
```

```
void checkComment(char *line) {
    if (line[0] == '/' && line[1] == '/') {
        printf("Valid single-line comment: %s\n", line);
    } else if (line[0] == '/' && line[1] == '*') {
        int len = strlen(line);
        if (line[len - 2] == '*' && line[len - 1] == '/') {
            printf("Valid multi-line comment: %s\n", line);
        } else {
            printf("Invalid comment or incomplete multi-line comment.\n");
        }
    } else {
        printf("Not a comment.\n");
    }
}
```

```
}
```

```
int main() {  
    char input[256];  
    printf("Enter a comment: ");  
    fgets(input, sizeof(input), stdin);  
    input[strcspn(input, "\n")] = 0; // Remove newline character  
  
    checkComment(input);  
    return 0;  
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\2d.exe  
Enter a comment: //abc  
Valid single-line comment: //abc  
  
-----  
Process exited after 4.902 seconds with return value 0  
Press any key to continue . . .
```

➤ Transition diagram for unsigned numbers

Code:

```
#include <stdio.h>
#include <ctype.h>
```

```
// Enum to represent states in the transition diagram
```

```
typedef enum {
```

```
    START=12, DIGIT1=13, DOT=14, DIGIT2=15, E_STATE=16, SIGN=17,
    DIGIT3=18, OTHER=19, ERROR=20, ERROR2=21
```

```
} State;
```

```
int main() {
```

```
    char c;
```

```
    State state = START;
```

```
    printf("Enter a number: ");
```

```
    while ((c = getchar()) != '\n') {
```

```
        switch (state) {
```

case START:

```
    if (isdigit(c)) state = DIGIT1;  
    else state = ERROR;  
    break;
```

case DIGIT1:

```
    if (isdigit(c)) state = DIGIT1;  
    else if (c == '.') state = DOT;  
    else if (c == 'E' || c == 'e') state = E_STATE;  
    else state = ERROR;  
    break;
```

case DOT:

```
    if (isdigit(c)) state = DIGIT2;  
    else state = ERROR;  
    break;
```

case DIGIT2:

```
    if (isdigit(c)) state = DIGIT2;  
    else if (c == 'E' || c == 'e') state = E_STATE;  
    else state = ERROR;  
    break;
```

case E_STATE:

```
    if (c == '+' || c == '-') state = SIGN;
```

```
        else if (isdigit(c)) state = DIGIT3;
        else state = ERROR;
        break;

    case SIGN:
        if (isdigit(c)) state = DIGIT3;
        else state = ERROR;
        break;

    case DIGIT3:
        if (isdigit(c)) state = DIGIT3;
        else state = ERROR;
        break;

    default:
        state = ERROR;
        break;
}

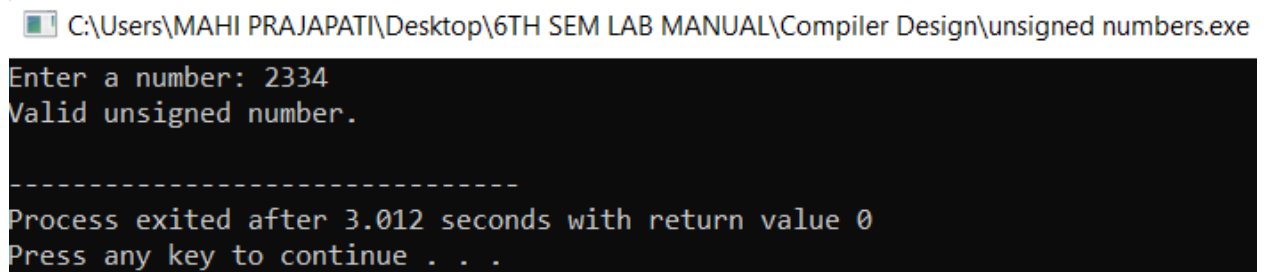

if (state == ERROR) break;
}

if (state == DIGIT1 || state == DIGIT2 || state == DIGIT3) {
    printf("Valid unsigned number.\n");
} else {
```

```
        printf("Invalid number.\n");
    }

    return 0;
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\unsigned numbers.exe
Enter a number: 2334
Valid unsigned number.
-----
Process exited after 3.012 seconds with return value 0
Press any key to continue . . .
```

e) Program to implement Lexical Analyzer.

Code:

```
#include <stdio.h>

#include <stdlib.h>

#include <ctype.h>

#include <string.h>

#define BUFFER_SIZE 1000

void check(char *lexeme);

int main() {
    FILE *f1;
```

```
char buffer[BUFFER_SIZE], lexeme[50]; // Static buffer for input and  
lexeme storage
```

```
char c;
```

```
int f = 0, state = 0, i = 0;
```

```
f1 = fopen("input.txt", "r");
```

```
if (f1 == NULL) {
```

```
    printf("Error opening file!\n");
```

```
    return 1;
```

```
}
```

```
fread(buffer, sizeof(char), BUFFER_SIZE - 1, f1);
```

```
buffer[BUFFER_SIZE - 1] = '\0'; // Null termination
```

```
fclose(f1);
```

```
while (buffer[f] != '\0') {
```

```
    c = buffer[f];
```

```
    switch (state) {
```

```
        case 0:
```

```
            if (isalpha(c) || c == '_') {
```

```
                state = 1;
```

```
                lexeme[i++] = c;
```

```
            } else if (isdigit(c)) {
```

```
                state = 13;
```

```
                lexeme[i++] = c;
```

```
            } else if (isspace(c)) {
```

```
        state = 0;
    } else if (c == '/') {
        state = 11;
    } else if (c == '\n') {
        state = 19;
        lexeme[i++] = c;
    } else if (c == '"') {
        state = 20;

Experiment – 3

Aim: To Study about Lexical Analyzer Generator (LEX) and Flex(Fast Lexical Analyzer)

Introduction:

A Lexical Analyzer converts an input stream (source code) into a sequence of tokens, which are then used by the parser in a compiler. Lex and Flex are tools designed for this purpose.

1. Lexical Analyzer Generator (LEX)

LEX is a tool used to generate lexical analyzers. It takes a set of regular expressions (token patterns) as input and produces a C program that can identify these tokens.

Working of LEX:

1. Specification File:

A LEX program consists of three sections:

- Definition Section: Declare header files and global variables.
- Rules Section: Define token patterns using regular expressions.
- C Code Section: Additional helper functions (optional).

2. Compilation Process:

- The LEX file (.l) is compiled using lex to generate lex.yy.c.
- The lex.yy.c file is compiled with a C compiler (gcc lex.yy.c -o output).
- The executable processes input and tokenizes it.

Example LEX Program:

```
% {  
#include <stdio.h>  
% }  
%%  
[0-9]+ { printf("Number: %s\n", yytext); }  
[a-zA-Z]+ { printf("Identifier: %s\n", yytext); }  
. { printf("Special Symbol: %s\n", yytext); }  
%%  
int main() {  
    yylex();  
    return 0;  
}  
int yywrap() { return 1; }
```

Commands to Run:

```
lex filename.l  
gcc lex.yy.c -o output  
./output < input.txt
```

2. Fast Lexical Analyzer (FLEX)

Flex is an improved and faster version of Lex. It provides better performance and extended functionality.

Key Features of FLEX:

- Works similarly to Lex, but faster.

- Generates a more optimized lex.yy.c.
- Supports additional options like debugging and performance tuning.

Example FLEX Program:

(Same structure as LEX)

```
% {  
#include <stdio.h>  
% }  
  
%%  
[0-9]+ { printf("Number: %s\n", yytext); }  
[a-zA-Z]+ { printf("Identifier: %s\n", yytext); }  
. { printf("Special Symbol: %s\n", yytext); }  
%%  
  
int main() {  
    yylex();  
    return 0;  
}  
  
int yywrap() { return 1; }
```

Commands to Run:

flex filename.l

gcc lex.yy.c -o output

./output < input.txt

Comparison: LEX vs FLEX

Feature	LEX	FLEX
Speed	Slower	Faster
Compatibility	Traditional UNIX tool	GNU version, supports more platforms
Debugging	Limited	More debugging options
Performance	Basic optimization	Highly optimized DFA

Conclusion:

- Lex and Flex automate the creation of lexical analyzers.
- Flex is an enhanced version of Lex and is more commonly used today.
- These tools simplify token generation in compiler design.

Experiment – 4

- a) Write a Lex program to take input from text file and count no of characters, no. of lines & no. of words.

Code:

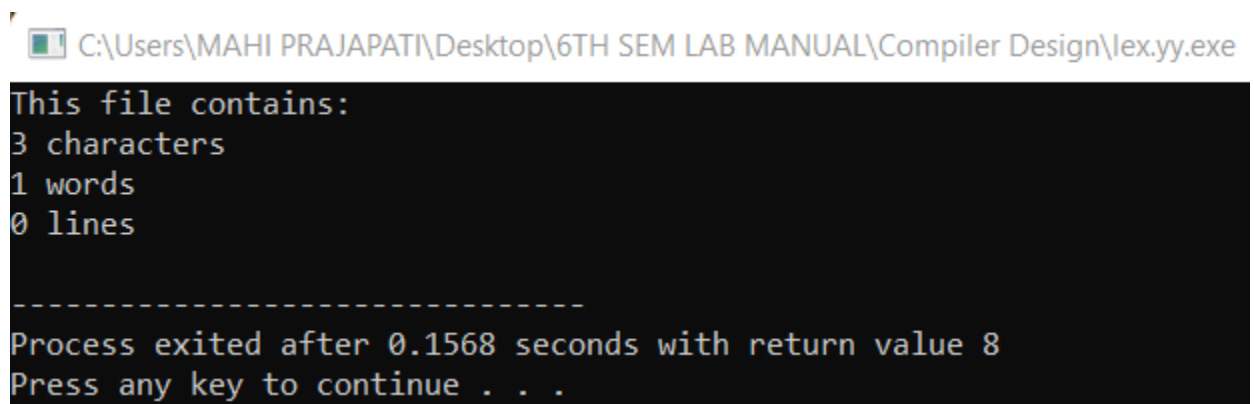

```
% {  
#include<stdio.h>  
  
int l = 0, w = 0, c = 0;  
int in_word = 0; // Flag to track words  
% }  
%%  
  
\n    { l++; c++; in_word = 0; } // Newline increases line and character  
count, resets word flag  
  
[ \t]+ { c += yyleng; in_word = 0; } // Spaces & tabs count as characters,  
reset word flag  
  
.    { c++; if (!in_word) { w++; in_word = 1; } } // Count characters, track  
words  
%%  
  
void main() {  
    yyin = fopen("input.txt", "r");  
    if (!yyin) {  
        printf("Error opening file\n");  
        return;  
    }  
    yylex();  
}
```

```
fclose(yyin);

printf("This file contains:\n");
printf("%d characters\n", c);
printf("%d words\n", w);
printf("%d lines\n", l);
}
```

```
int yywrap() { return 1; }
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\lex.yy.exe

This file contains:
3 characters
1 words
0 lines

-----
Process exited after 0.1568 seconds with return value 8
Press any key to continue . . .
```

- b) Write a Lex program to take input from text file and count number of vowels and consonants.

Code:

```
% {
#include<stdio.h>

int vowels = 0, consonants = 0;

% }

%%
```

```
[aAeEiIoOuU] { vowels++; }    // Count vowels
[b-df-hj-np-tv-zB-DF-HJ-NP-TV-Z] { consonants++; } // Count
consonants

.      { } // Ignore other characters
\n     { } // Ignore newlines

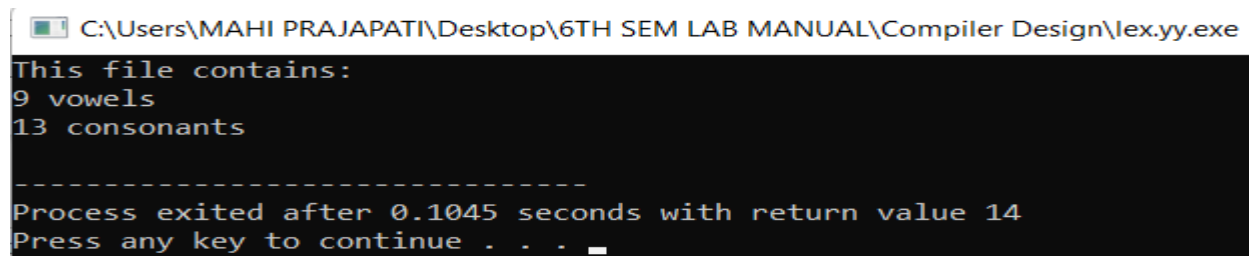

%%

void main() {
    yyin = fopen("input.txt", "r");
    if (!yyin) {
        printf("Error opening file\n");
        return;
    }
    yylex();
    fclose(yyin);

    printf("This file contains:\n");
    printf("%d vowels\n", vowels);
    printf("%d consonants\n", consonants);
}

int yywrap() { return 1; }
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\lex.yy.exe
This file contains:
9 vowels
13 consonants
-----
Process exited after 0.1045 seconds with return value 14
Press any key to continue . . . _
```

c) Write a Lex program to print out all numbers from the given file.

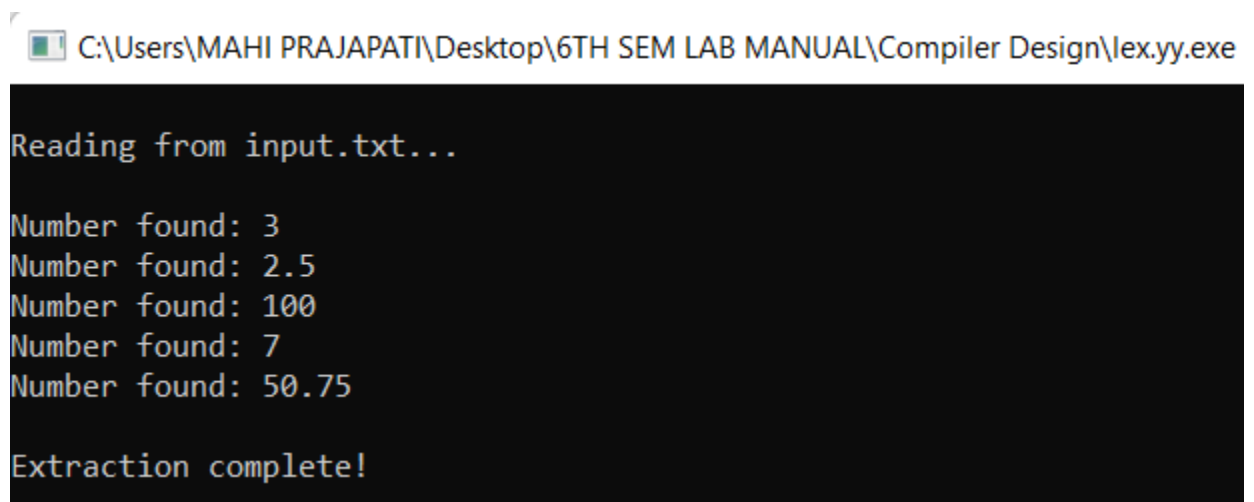

Code:

```
% {  
#include <stdio.h>  
#include <stdlib.h>  
  
FILE *fp;  
% }  
  
%%  
  
[0-9]+(\\.[0-9]+)? { printf("Number found: %s\\n", yytext); }  
  
.\\n { } // Ignore everything else  
  
%%  
  
int main() {  
    fp = fopen("input.txt", "r"); // Open input file  
    if (fp == NULL) {  
        printf("\\nError: Could not open input.txt!\\n");  
        return 1;  
    }  
  
    yyin = fp; // Set input source to file
```

```
printf("\nReading from input.txt...\n\n");  
yylex(); // Process input file  
fclose(fp); // Close file after processing  
  
printf("\nExtraction complete!\n");  
return 0;  
}
```

```
int yywrap() { return 1; }
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\lex.yy.exe  
  
Reading from input.txt...  
  
Number found: 3  
Number found: 2.5  
Number found: 100  
Number found: 7  
Number found: 50.75  
  
Extraction complete!
```

- d) Write a Lex program which adds line numbers to the given file and display the same into different file.

Code:

```
%{  
  
#include <stdio.h>  
  
int line_number = 1;
```

```
FILE *output;

% }

%%

^.* { fprintf(output, "%d: %s\n", line_number++, yytext); } // Add line
numbers

%%

void main() {

    yyin = fopen("input.txt", "r"); // Open input file
    if (!yyin) {
        printf("Error opening input file\n");
        return;
    }

    output = fopen("output.txt", "w"); // Open output file
    if (!output) {
        printf("Error opening output file\n");
        return;
    }

    yylex(); // Process file

    fclose(yyin);
    fclose(output);

    printf("Processed file saved as 'output.txt'\n");
```

```
}
```

```
int yywrap() { return 1; }
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design\lex.yy.exe

Processed file saved as 'output.txt'

-----
Process exited after 0.0846 seconds with return value 0
Press any key to continue . . .

1: There are 3 apples, 2.5 kg of sugar, and 100 mangoes.
2: Also, 7 people bought 50.75 liters of juice.
```

- e. Write a Lex program to printout all markup tags and HTML comments in file.

Code:

Lex.l:

```
% {
#include<stdio.h>

int num=0;

% }

%%

"<"/A-Za-z0-9]+>" printf("%s is valid markup tag\n",yytext);
```

```
"<!--"[^--]*"-->"  num++;  
  
\n  ;  
  
.  ;  
  
%%  
  
int main()  
{  
yyin=fopen("myfile.txt","r");  
yylex();  
return 0;  
}  
int yywrap(){return(1);}
```

myfile.txt:

```
<html>  
  
<div>  
  
<body>  
  
</html>  
  
<head>  
  
<a>  
  
</a>
```

O/P:

```
C:\Windows\System32\cmd.exe
C:\Users\MAHI PRAJAPATI\Downloads>flex cd4.1
C:\Users\MAHI PRAJAPATI\Downloads>gcc lex.yy.c -o tagprinter
C:\Users\MAHI PRAJAPATI\Downloads>tagprinter.exe
<html> is valid markup tag
<div> is valid markup tag
<body> is valid markup tag
</html> is valid markup tag
<head> is valid markup tag
<a> is valid markup tag
</a> is valid markup tag
```

Experiment – 5

- a. Write a Lex program to count the number of C comment lines from a given C program. Also eliminate them and copy that program into separate file.

Code:

Lex.l:

```
% {
#include <stdio.h>
int c = 0; // Counter for comment lines
% }

%x COMMENT

%%

"/".*    { c++; } // Count single-line comments

"/*"     { c++; BEGIN(COMMENT); } // Start multi-line comment
<COMMENT>"*/" { BEGIN(INITIAL); } // End multi-line comment
<COMMENT>\n  { c++; }           // Count each line in multi-line
comment
<COMMENT>|.  { /* ignore comment content */ }

.|\\n    { fprintf(yyout, "%s", yytext); } // Copy non-comment text

%%

int main() {
    yyin = fopen("code.txt", "r");
    yyout = fopen("output.txt", "w");

    if (!yyin) {
        perror("Error opening input file");
        return 1;
    }
}
```

```
if (!yyout) {
    perror("Error opening output file");
    return 1;
}

yylex();

printf("Total comment lines removed: %d\n", c);

fclose(yyin);
fclose(yyout);
return 0;
}

int yywrap() {
    return 1;
}
```

Code.txt:

```
#include <stdio.h>
```

```
// This is a single-line comment
```

```
int main() {
    printf("Hello, World!\n"); /* This is a block comment */
    return 0;
//gyhtyrt
}
```

O/P:

```
C:\Windows\System32\cmd.exe
C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design>flex 5a.1

C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design>gcc lex.yy.c -o commentremover

C:\Users\MAHI PRAJAPATI\Desktop\6TH SEM LAB MANUAL\Compiler Design>commentremover.exe
Total comment lines removed: 3
```

- b. Write a Lex program to recognize keywords, identifiers, operators, numbers, special symbols, literals from a given C program.

Code:

Lex.l –

```
% {  
#include <stdio.h>  
% }  
  
%%  
"int"|"float"|"if"|"else"|"while"|"return"|"char"|"for"|"do"|"switch" {  
printf("%s is a keyword\n", yytext); }  
[aeiouAEIOU] {printf("%s is a vowels\n",yytext);}   
[a-zA-Z_][a-zA-Z0-9_]* { printf("%s is an identifier\n", yytext); }  
[ \t\n]+ ; // This will ignore spaces, tabs, and newlines  
%%  
int main() {  
    yyin=fopen("cd1.txt","r");  
    yylex();  
    return 0;  
}  
int yywrap() { return 1; }
```

txt file –

```
helo_12  
An apple  
Int
```

O/P:

```
C:\Windows\System32\cmd.exe  
C:\Users\MAHI PRAJAPATI\Downloads>flex keywords.1  
C:\Users\MAHI PRAJAPATI\Downloads>gcc lex.yy.c -o tagscanner  
C:\Users\MAHI PRAJAPATI\Downloads>tagscanner.exe  
helo_12 is an identifier  
An is an identifier  
apple is an identifier  
int is a keyword
```

Experiment – 6

Aim: Program to implement Recursive Descent Parsing in C.

Code:

```
#include<stdio.h>

#include<stdlib.h>

/*
E-> iE_
E_ -> +iE_ / -iE_ / epsilon
*/

char s[20];
int i=1;
char l;
int match(char t)
{
    if(l==t){
        l=s[i];
        i++; }
    else{
        printf("Sytax error");
        exit(1);}
}

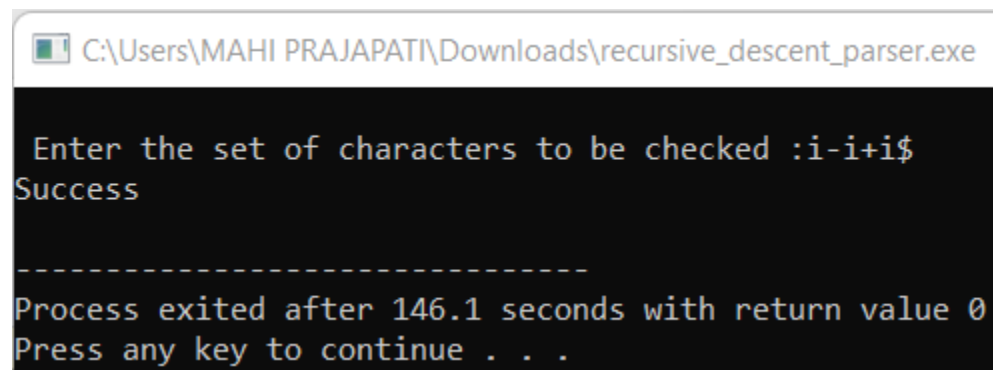

int E_()
{
    if(l=='+'){
        match('+');
```

```
        match('i');
        E_(); }
else if(l=='-'){
    match('-');
    match('i');
    E_(); }
else
    return(1);
}
int E()
{
    if(l=='i'){
        match('i');
        E_(); }
}

int main()
{
    printf("\n Enter the set of characters to be checked :");
    scanf("%s",&s);
    l=s[0];
    E();
    if(l=='$')
    {
        printf("Success \n");
```

```
}  
else{  
    printf("syntax error");  
}  
return 0;  
}
```

O/P:

```
C:\Users\MAHI PRAJAPATI\Downloads>recursive_descent_parser.exe  
Enter the set of characters to be checked :i-i+i$  
Success  
-----  
Process exited after 146.1 seconds with return value 0  
Press any key to continue . . .
```

Experiment – 7

a. To Study about Yet Another Compiler-Compiler (YACC).

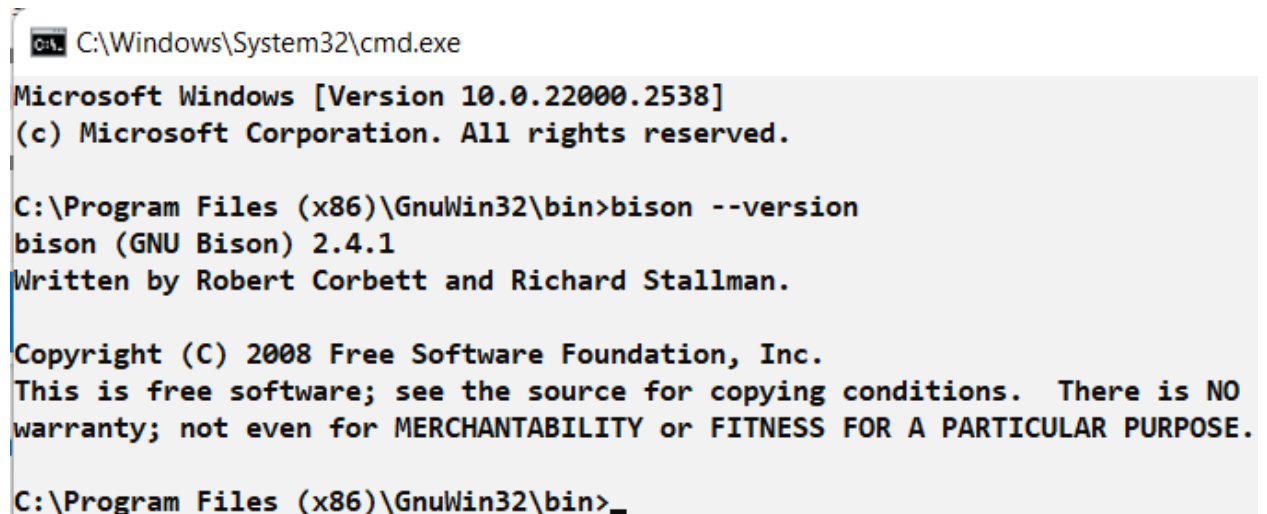

Introduction:

YACC (Yet Another Compiler-Compiler) is a parser generator developed to automate the process of creating the syntax analysis phase of a compiler. It reads a grammar specification written in a format similar to Backus-Naur Form (BNF) and generates a parser in the C programming language. This parser can recognize the syntax of a programming language and build syntax trees or perform semantic actions.

YACC is typically used in combination with **LEX/Flex**, where LEX handles lexical analysis and YACC handles syntax analysis. Together, they allow for the development of efficient and structured compilers. The grammar rules in YACC are written in the form of production rules, and associated C code (semantic actions) can be embedded within these rules to define what happens when a rule is recognized.

YACC Features:

- Supports LALR (1) parsing.
- Allows easy embedding of semantic actions using C code.
- Automatically handles parsing tables and parser generation.
- Provides error-handling mechanisms for syntax errors.
- Easily integrates with Flex for complete compiler front-end development.

```

```

b. Create Yacc and Lex specification files to recognizes arithmetic expressions involving +, -, * and / .

Lex.l:

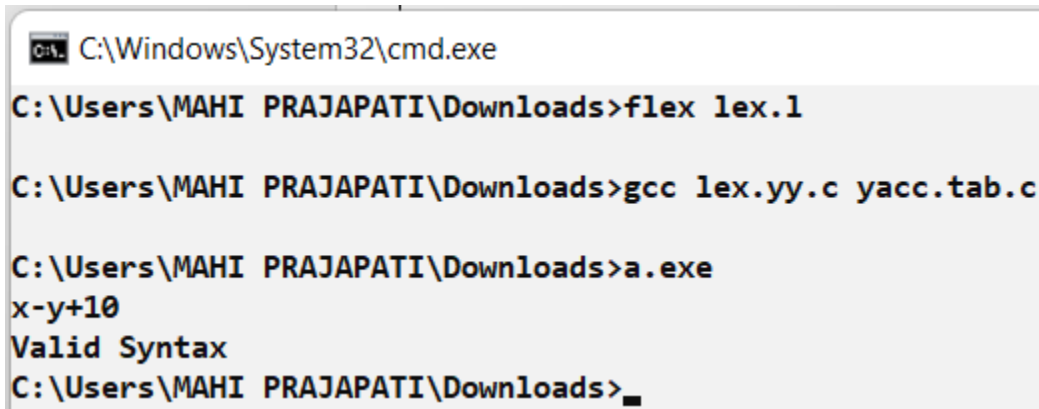

```
% {  
  
#include <stdlib.h>  
  
void yyerror(char *);  
  
#include "yacc.tab.h"  
  
% }  
  
%%  
  
[0-9]+ { yylval = atoi(yytext); return NUM; }  
[a-zA-Z_][a-zA-Z_0-9]* { return id; }  
[-+*/\n] { return *yytext; }  
[ \t] { }  
  
. yyerror("invalid character");  
  
%%  
  
int yywrap() {  
    return 0;  
}
```

yacc.y:

```
% {  
  
#include <stdio.h>  
  
int yylex(void);  
  
void yyerror(char *);  
  
% }  
  
%token NUM
```

```
%token id
%%
S: E '\n' { printf("Valid Syntax"); return(0); }
E: E '+' T { }
  | E '-' T { }
  | T      { }
T : T '*' F { }
  | T '/' F { }
  | F      { }
F: NUM    { }
  | id     { }
%%
void yyerror(char *s) {
    fprintf(stderr, "%s\n", s);
}
int main() {
    yyparse();
    return 0;
}
```

O/P:

```
C:\Windows\System32\cmd.exe
C:\Users\MAHI PRAJAPATI\Downloads>flex lex.l
C:\Users\MAHI PRAJAPATI\Downloads>gcc lex.yy.c yacc.tab.c
C:\Users\MAHI PRAJAPATI\Downloads>a.exe
x-y+10
Valid Syntax
C:\Users\MAHI PRAJAPATI\Downloads>
```

- c. Create Yacc and Lex specification files are used to generate a calculator which accepts integer type arguments.

Code:

Lex.l:

```
% {
#include <stdlib.h>
void yyerror(char *);
#include "yacc.tab.h"
% }
%%
[0-9]+ {yylval = atoi(yytext); return NUM;}
[-+*\n] {return *yytext;}
[ \t] { }
. yyerror("invalid character");
%%
int yywrap() {
return 0;
}
```

yacc.y –

```
% {
#include <stdio.h>
int yylex(void);
void yyerror(char *);
```

```
% }
%token NUM
%%
S: E '\n' { printf("%d\n", $1); return(0); }
E: E '+' T { $$ = $1 + $3; }
  | E '-' T { $$ = $1 - $3; }
  | T      { $$ = $1; }
T: T '*' F { $$ = $1 * $3; }
  | F      { $$ = $1; }

11
```

- d. Create Yacc and Lex specification files are used to convert infix expression to postfix expression.

Code:

Lex.l –

```
% {
#include <stdlib.h>
#include "infix_to_postfix.tab.h"
void yyerror(char *);
% }
%%
[0-9]+ {yylval.num = atoi(yytext); return INTEGER;}
[A-Za-z_][A-Za-z0-9_]* {yylval.str = yytext; return ID; }
[-+*\n] {return *yytext;}
[ \t] ;
. yyerror("invalid character");
%%

int yywrap() {
    return 1;
}
```

Yacc.y –

```
% {
#include <stdio.h>
int yylex(void);
void yyerror(char *);
% }
%union {
    char *str;
    int num;
}
%token <num> INTEGER
%token <str> ID
%%
S: E '\n' { printf("\n"); }
E: E '+' T { printf("+ "); }
  | E '-' T { printf("- "); }
```

```
| T      { }  
T : T '*' F { printf("* "); }  
| F      { }  
F : INTEGER { printf("%d ", $1); }  
| ID      { printf("%s ", $1); }  
%%  
void yyerror(char *s) {  
    printf("%s\n", s);  
}  
int main() {  
    yyparse();  
    return 0;  
}
```

O/P:

```
C:\Windows\System32\cmd.exe - a.exe  
C:\Users\MAHI PRAJAPATI\Downloads>bison -d infix_to_postfix.y  
C:\Users\MAHI PRAJAPATI\Downloads>flex infix_to_postfix.l  
C:\Users\MAHI PRAJAPATI\Downloads>gcc lex.yy.c infix_to_postfix.tab.c  
C:\Users\MAHI PRAJAPATI\Downloads>a.exe  
a+b*c  
a b c * +
```
